

## What is a TLA100?

The TLA100 is a tank level adapter that converts an analog resistive tank sender into digital information, which is then broadcast over the NMEA 2000 where any NMEA 2000 compatible display can show the tank level. Once properly configured, the TLA100 can also transmit the fluid type and the capacity of the tank. The TLA100 can be used with or without analog gauges and it can be calibrated for odd-sized tanks making it the most versatile tank level adapter on the market today.
