

Can Maretron's sensor data be displayed on a Furuno CANBUS network?

Yes, much of Maretron device's data can be shown on Furuno displays with "CANBUS" functionality. Firstly, Maretron recommends that customers verify device compatibility by reviewing the [Maretron product's datasheet](#) specifically, the transmit PGN section of the datasheet (page 2). Second, review the Chart plotters datasheet for Received PGN list for display to confirm the compatibility.

Please note: Maretron devices allow for multi message distinction for example: PGN 130314(Temperature) allows for source selection with instance number selection, a configuration that can only be adjusted using a Maretron interface. The device configuration can be performed using a Maretron [DSM150/250/410](#) or our [N2KAnalyzer software](#) tool only.
